

lotlight

NOTICE
TO RESPONSE

A notice is only the beginning.

Lotlight helps independent clinics reconcile a medical recall notice with spreadsheet inventory, resolve uncertain identifiers, and document a response someone owns.

THE PROBLEM

A recall letter is not a completed stock check. Product names vary, lot fields are missing, and responsibility can get lost between a notice and a shelf.

THE WORKING PRODUCT

Import a notice and CSV. Compare each catalog/lot pair with source evidence. Confirm the source, assign an owner, record quantities handled, and export the audit.

A REAL NOTICE. A CLEARLY SYNTHETIC CLINIC.

The demo uses two pairs from Baxter notice FA-2025-039 (29 Aug 2025). Eight fictional stock lines contain two exact matches, two incomplete records, and four lines outside the entered scope. No patient data or current recall status is implied.

AI WITH A BOUNDARY

A pinned MiniLM model compares descriptions locally in a browser worker, without paid inference APIs. AI can surface aliases. Only deterministic identifier rules establish matches; a person confirms the source and response.

ENGINEERING THAT MATTERS

Private sign-in and database persistence. Server-validated actions. Versioned source and inventory snapshots. Conflicting-save protection. Unknown identifiers cannot close; partial quantities stay open.

COMMERCIAL HYPOTHESIS

Start with independent clinics using spreadsheet stock records. Test **\$149/site/month**: at an assumed \$30/hour staff cost, five hours saved covers the fee. Existing enterprise competitors validate the category; clinic demand and savings still need a supervised pilot.

VALIDATION & LIMITS

Automated tests cover scope pairing, missing identifiers, workflow gates, import validation and version changes. Browser tests exercise sign-in, persistence, response completion and exports. This is a hackathon MVP, not clinically validated or approved for unsupervised clinical use. Shared team roles, OCR and complex recall scope remain future work.
